(54) ELECTRIC PROPERTIES MEASUREMENT PROBE

(57)Abstract:

PURPOSE: To provide excellent positional accuracy and flatness and high mechanical strength of a contactor and hence enhance the measurement durability and reliability of the contactor by obtaining an electric properties measurement probe having contactors as a fine array pitch since this probe is manufactured based on such a process as photolithograph and thin film formation.

CONSTITUTION: This is designed based on a cantilever beam structure 15 which comprises single crystal silicon, silicon oxide and nitriding silicon and polysilicon or at least one metal layer. A continuity metal film 14 is formed on the surface. This cantilever beam structure 15 is held by an insulation board 18 which forms a continuity wiring pattern 19, thereby using this as an electric properties measurement probe.
